

A Wetter pattern ahead?

Most model and ensemble solutions indicate a break in the subtropical ridge over or just west of our region next week. This would bring increasing moisture and rainfall to our region. In part, due to more of a southwest flow aloft and a typical Bermuda surface high that would supply ample Gulf of Mexico and western Atlantic moisture across NC.

The 8-14 Day Precipitation Outlook from the Hydrologic Prediction Center shows the potential for above normal precipitation across the Carolinas, Mid Atlantic and the Ohio Valley.
